

# GSM-Guard

## For protection and monitoring of truly remote locations

For truly remote applications, where a mains supply and telephone landline may not be available, and monitoring from a long distance is required, this superb little unit will keep you in touch with your assets via the mobile phone (GSM) network.

The GSM-Guard unit comes in a sturdy weatherproof enclosure and may be deployed outside with no protection from the elements. It incorporates a highly sophisticated GSM paging unit, with a variety of digital and analogue input channels. Whenever one of these channels is triggered a text message (SMS) will be sent to a selection of pre-programmed mobile numbers (max. 6).

GSM-Guard is ideal for temporary or permanent installation in remote properties with or without mains power, as it operates on a 12 volt supply. It will run on a car battery quite happily for typically 2 months between charges. An optional internal battery pack is available, which allows the system to be truly portable and easy to hide.

The unit pictured above incorporates a built-in infra-red motion sensor with a 30m detection range. Apart from security, applications include the instant reporting of machine-shutdown, pump-failure, over-temperature in chicken houses, under-temperature in greenhouses and flooding.

Please call us for information and advice on the many applications of this amazingly versatile tool.

Prices from **£289** + VAT (including pre-paid SIM card)
